```
Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Search time 30.01 Seconds (without alignments) 5.585 Million cell updates/sec

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                        R59496-R61666 are immunogenic 10mer peptides that contain a HLA-A2.1 binding motif. These peptides bind HLA-A2.1 and have a binding affinity of at least 1% as compared to a reference peptide (R71293). R61525 has an IC50 of 0.018 and the sequence occurs at position 773 in the human c-ERB2 gene product. Peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (CTLs) which specifically target malignant cells. The peptide corresponds to amino acids 773-782 of human Her-2/Neu protein. CTL-activating peptides can be used in a vaccine for protecting against tumour cell formation. CTLs activated by the peptides will lyse tumour cells displaying specific peptides. Antibodies against CTL-activating peptides are useful for the identification of other similar compounds which may be useful for treating cancer or virally-infected cells, or for diagnosis. The peptide and vaccines produced provide immunity to a high percentage of different ethnic groups, i.e. those with different HLA alleles.
                                                                                                                                                                                        Her-2/neu protein; human leukocyte antigen A2.1; HLA; cytotoxic T lymphocyte; CTL; immune response; tumour-T-cell receptor; TCR; tumour treatment.

Cells expressing recombinant TCR are used to identify antigens associated with a tumour and to treat tumours in humans. Transgenic mid are a more convenient source of CTL than the tumour-infiltrating lymphocytes previously used. TCR can be humanised to reduce side-reactions and short peptide derivatives of TCR are more economical to produce than TCR itself, particularly when expressed as a discrete content of the terms of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          positions 773-782. The ability of these peptides to inhibit the binding of an influenza virus matrix protein peptide M1 to HLA A2.1 was measured by inhibition of lysis by an M1 specific, HLA A2.1 restricted, cytotoxic Tlymphocyte (CTL) clone. The present protein showed 55% inhibition. The peptides were also tested for their ability to elicit an immune response in vivo. However, only H3 (W36824) and H7 (W36826) were able to do this. H3 and H7 peptides are tumour-associated antigens, and were used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immunize a transgenic, non-human vertebrate (that has been modified to express at least one HLA antigen), so that the animal produces CTL which displays HLA-restricted T-ceal receptor (TCR) specificity for the antigen.          Sequences shown in W70053 to W70075 represent peptides derived free HER-2/neu (cerB-2) antigen. The peptides can bind to a human leuk antigen (HLA), HLA-A2.1 and are used to exemplify the method of invention of producing antigen-specific cytotoxic T cells (CTLs) vitro. The method comprises contacting immunogenic peptides from antigen that binds class I major histocompatibility complex (MHC)
                                                                                                                                                         Production of antigen-specific cytotoxic T cells - by incubating immunogenic peptide(s) from antigen that binds class I major histocompatibility complex molecules with pre-treated antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human leukocyte antigen; HLA; tumour associated antigen; cancer; antigen presenting cell; APC; immunogenic peptide; immune disorder; viral infection; MIDS; hepatitis; bacterial infection; malaria;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              W70071;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            than the native epitope. The epitopes can be used in a disease-specific immunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different cross-reactive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The peptide epitope W77119-W77138 were created for human tumour-specific cytotoxic T lymphocyte response. These peptides are are cysteine-depleted mutants of a native disease-specific CTL epitope. The cysteine depleted CTL epitopes elicit a stronger or more specific CTL response depleted CTL epitopes elicit a stronger or more specific CTL response
                                                                                                                                                                                                                                                    Celis E,

The present invention relates to a new pharmaceutical composition comprising a unit dose form of a peptide, or analogue, comprising an epitope selected from those represented by peptides Y98812-Y99339 which are derived from various antigens for various human leucocyte antigen class DR molecules, representative of the world wide population. The peptide/analogue binds to an HLA class II molecule at an IC-50 of less than or equal to 1,000 nM. The pharmaceutical can be used to induce a helper T cell response. The pharmaceutical focuses the immune response towards selected determinants and could therefore be used in cases of chronic viral diseases and cancer. Examples of diseases that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     pretreatment growth factors, and incubating the APCs with purified CD8 cells in the presence of at least 2 incubation growth factors, thereby producing antigen-specific CTLs. A method for specifically killing target cells in a human patient is also provided which comprises obtaining a fluid sample containing CTLs from a patient, contacting the cytotoxic T cells with APCs pretreated with pre-treatment growth factors, where the APCs comprise class I MHC molecules. The pretreated APCs are incubated with the cytotoxic growth factors, thereby producing activated CTLs which are contacted with a carrier to form a composition. The composition can then be administered to the patient. The activated CTLs can be used for treating cancers, immune disorders, viral infections, ALDS, hepatitis, bacterial infection, fungal infection, malaria or interesting cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human leucocyte antigen; HLA class II; antigen epitope; pharmaceutical; immune response; chronic viral disease; cancer; autolimmune disease; rhoumatoid arthritis; multiple sclerosis; myasthenia gravis; AIDS; allograft rejection; allergy; lyme disease; hepatitis; prostate cancer; glomerulonephritis; food hypersensitivity; malaria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               treated using the peptide containing pharmaceutical include autoimmune claimed diseases (rheumatoid arthritis, multiple sclerosis, and myasthenia crystals), allograft rejection, allergies, lyme disease, hepatitis, cost-streptococcal endocarditis or glomerulonephritis and food post-streptococcal endocarditis or glomerulonephritis and food chypersensitivities. The peptide epitopes can be used to enhance immune cresponses against other immunogens administered with the peptides. Claseases which can be treated using immunogenic mixtures include prostate cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, cervical cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, cervical cancer to make monoclonal antibodies useful as potential diagnostic or treatment enoncolonal antibodies useful as potential diagnostic or reagents, for example, to determine the susceptibility of an individual conditional actions the susceptibility of an individual condition of appropriate T and B cell epitopes should allow the selection of appropriate T and B cell epitopes should allow the epitopes of pathogens which are characterized by high sequence variability such as HIV, HCV and Malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

CC Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are CC normally induced by an antigen in the form of a peptide fragment bound CC to a HLA molecule, rather than the intact foreign antigen itself, and CC are particularly important in tumour rejection and in fighting viral CC infections. The peptides are therefore useful therapeutically to treat CC or prevent viral infections and cancers in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. CC They can be administered as vaccines to elicit an immune response in CC individuals susceptible or otherwise at risk of viral infection or CC cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell cancer, by contacting a cytotoxic T cell with the peptide e.g. to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HIA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C. AIDS, and renal carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.
                                                                                                                                                                                                                                                                                                                       13-MAR-1998;
                                                                                                                                                                                                                                                                                                                                                      16-SEP-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are commanily induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and infections. The peptides are therefore useful therapeutically to treat crime or prevent viral infections and cancers in mammals (especially humans) cc. e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. CT They can be administered as vaccines to elicit an immune response in conditionals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell cresponse, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The cc polynucleotides encoding the immunogenic peptides are also useful to the conditions of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
peptides having an HLA-A3.2, HLA-A1, HLA-A11 or HLA-A24.1 binding motif. For example, the peptides having an HLA-A3.2 binding motif. For example, the peptides having an HLA-A3.2 binding motif each have 9-10 residues and contain, from the N-terminus to the C-terminus, (a) a first conserved residue selected from L, M, I, V, S, A, T, F, C, G, D and E and (b) a second conserved residue of K, R, Y, H or F, where the first and second conserved residue of separated by 6-7 residues. The peptides are

2 (45390 to y48214 represent specifically claimed immunogenic peptides CC having a human major histocompatibility complex (MHC) Class I (also CC known as human leukocyte antigen (HLA) binding motif. The immunogenic CC peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell Cresponse against the antigen from which the peptide is derived. CC Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are CC normally induced by an antigen in the form of a peptide fragment bound CC to a HLA molecule, rather than the intact foreign antigen itself, and CC are particularly important in tumour rejection and in fighting viral CC infections. The peptides are therefore useful therapeutically to treat CC or prevent viral infections and cancers in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. CC They can be administered as vaccines to elicit an immune response in CC cancer, or used to treat chronic or acute conditions. They are also cancer, or used to treat chronic or acute conditions. They are also cancer, or used to treat chronic or acute conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     selected MHC molecules and inducing an immune response. They can be used to treat and/or prevent viral infection and cancer, e.g. prostate cancer, lymphoma, hepatitits or AIDS. They can also be used to produce antibodies for use as diagnostic or therapeutic agents. The peptides can also be used as diagnostic agents.

                                                                               towards selected determinants and could therefore be used in cases of chronic viral diseases and cancer. Examples of diseases that can be treated using the peptide containing pharmaceutical include autoimmune diseases (rheumatoid arthritis, multiple sclerosis, and myasthenia gravis), allograft rejection, allergies, lyme disease, hepatitis, post-streptococcal endocarditis or glomerulonephritis and food
                                                                                                                                                                                      class DR molecules, representative of the world wide population. The peptide/analogue binds to an HLA class II molecule at an IC-50 of less than or equal to 1,000 nM. The pharmaceutical can be used to induce a helper T cell response. The pharmaceutical focuses the immune response
              hypersensitivities. The peptide epitopes can be used to enhance immune responses against other immunogens administered with the peptides. Diseases which can be treated using immunogenic mixtures include prostate cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, cervical
                                                                                                                                                                                                                                                        The present invention relates to a new pharmaceutical composition comprising a unit dose form of a peptide, or analogue, comprising an epitope selected from those represented by peptides y98812-y9939 which are derived from various antigens for various human leucocyte antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  glomerulonephritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            response, by contacting a cytotoxic T cell with the peptide e.g. produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human leucocyte antigen; HLA class II; antigen epitope; pharmaceutical; immune response; chronic viral disease; cancer; autoimmune disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Y98860 standard; Peptide; 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          therapeutically and for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                used to make monoclonal antibodies useful as potential diagnostic or therapeutic agents. The peptides may also be useful as diagnostic reagents for example, to determine the susceptibility of an individual to a treatment regimen. Also, the peptides may be used to predict which individuals will be at substantial risk of developing chronic infection. The selection of appropriate T and B cell epitopes should allow the development of epitope based vaccines particularly towards conserved epitopes of pathogens which are characterized by high sequence
(TRP-2). This region contains the peptide epitope of TRP-2 that is able to stimulate cytokine release by CTL cells. Apart from W30829-30 (these contain extra residues at the N-terminal (W30829) the C-terminal (W30830)), the peptides were modified to contain substitutions at the anchor residues.
                                                                                                                                                Cancer antigen peptide(s) derived from the tyrosinase-related protein 1 or 2 - useful for detecting, preventing or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic

are derived from various antigens for various human leucocyte antigen class DR molecules, representative of the world wide population. The peptide/analogue binds to an HLA class II molecule at an IC-50 of less than or equal to 1,000 nM. The pharmaceutical can be used to induce a helper T cell response. The pharmaceutical focuses the immune response towards selected determinants and could therefore be used in cases of chronic viral diseases and cancer. Examples of diseases that can be treated using the peptide containing pharmaceutical include autoimmune diseases (rheumatoid arthritis, multiple sclerosis, and myasthenia gravis), allograft rejection, allergies, lyme disease, hepatitis, post-streptococcal endocarditis or glomerulonephritis and food
                                                                                                                                                                                                      The present invention relates to a new pharmaceutical composition comprising a unit dose form of a peptide, or analogue, comprising epitope selected from those represented by peptides Y98812-Y99339
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human leucocyte antigen; HLA class II; antigen epitope; pharmaceutical; immune response; chronic viral disease; cancer; autoimmune disease; rheumatoid arthritis; multiple sclerosis; myasthenia gravis; AIDS; allograft rejection; allergy; lyme disease; hepatitis; prostate cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                W30829-38 were able to stimulate cytokine release. Other antigenic peptides have also been identified from TRP-1. The nucleic acids encoding the cancer peptides or TRP-2 can be used to detect a cancer or pre-cancer in a mammal, especially by detecting the presence of the alterative ORF 3 of the TRP-1 gene or the sequence encoding the novel tumour antigen TRP-2. Vectors and recombinant viruses containing antigen peptide encoding nucleic acids, antibodies raised against the peptides, or the peptides themselves can be used to prevent or treat a cancer in a mammal,
                                                                                                                                                                                                                                                                                    Claim 1;
                                                                                                                                                                                                                                                                                                                                                                             WPI; 2000-097143/08.

The peptide epitopes can be used to enhance immune responses against other immunogens administered with the peptides. Diseases which can be treated using immunogenic mixtures include prostat cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, cervical carcinoma, lymphoma, and condyloma acuminatum. The peptides may also be used to make monoclonal antibodies useful as potential diagnostic or therapeutic agents. The peptides may also be useful as diagnostic reagents, for example, to determine the susceptibility of an individual to a treatment regimen. Also, the peptides may be used to predict which individuals will be at substantial risk of developing chronic infection. The selection of appropriate T and B cell epitopes should allow the development of epitope based vaccines particularly towards conserved epitopes of pathogens which are characterized by high sequence
                                                                                                                         Cancer antigen peptide(s) derived from the tyrosinase-related protein 1 or 2 - useful for detecting, preventing or treating cancer in a mammal, especially melanoma
                                                                           Claim 17; Page 56; lllpp; English

This region contains the peptide epitope of TRP-2 that is able to stimulate cytokine release by CTL cells. Apart from w30829-30 (these contain extra residues at the N-terminal (W30829) and the C-terminal (W30830)), the peptides were modified to contain substitutions at the anchor residues. Of all these peptides, only W30829-38 were able to stimulate cytokine release. Other antigenic peptides have also been identified from TRP-1. The nucleic acids encoding the cancer peptides or TRP-2 can be used to detect a cancer or pre-cancer in a mammal, especially by detecting the presence of the alterative ORF 3 of the TRP-1 gene or the sequence encoding the novel tumour antigen encoding nucleic acids, antibodies raised against the peptides, or the peptides themselves can be used to prevent or treat a cancer in a mammal,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tyrosinase related protein 2 gene; TRP-1; gp75; tumour antigen; tumour infiltrating lymphocyte; TIL; TIL586; cancer peptide; TR alternative reading frame; cancer detection; pre-cancer detecti
                                        Cancer antigen peptide(s) derived from the tyrosinase-related protein 1 or 2 - useful for detecting, preventing or treatin cancer in a mammal, especially melanoma
                                                                                                                                                                                                                                                                               04-OCT-1996;

밁 Ş

Peptides W30829-38 and W37011-21 are modified versions of a peptide derived from positions 197-205 of the tyrosinase related protein 2

Peptides W38103-05 are peptide recognition units that are based on sequences of the YAP WM domain binding proteins WBP-1 and WBP-2. The were used to screen human bone marrow and brain cDNA libraries. The cDNA clones were identified and isolated. These clones represented novel human genes WWP1 (W36794), WWP2 (W36795) and WWP3 (W36796).

and WWP3 (W36796). The

This region contains the peptide epitope of TRP-2 that is able to stimulate cytokine release by CTL cells. Apart from W30829-30 (these contain extra residues at the N-terminal (W30829) and the C-terminal (W30830)), the peptides were modified to contain substitutions at the anchor residues. Of all these peptides, only W30829-38 were able to stimulate cytokine release. Other antigenic peptides have also been identified from TRP-1. The nucleic acids encoding the cancer peptides or TRP-2 can be used to detect a cancer or pre-cancer in a mammal, especially by detecting the presence of the alterative ORF 3 of the TRP-1 gene or the sequence encoding the novel tumour antigen encoding nucleic acids, antibodies raised against the peptides, or the peptides themselves can be used to prevent or treat a cancer in a mammal,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                W38105;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          W38105

Its name is derived from the observation that two tryptophan residues, one in the amino terminal portion of the WW domain and one in the carboxyl terminal portion, are conserved. Most proteins containing WW domains have a function involving cell signalling and growth regulation or the organisation of the cytoskeleton. Polypeptides containing a WW domain are identified by treating a multivalent recognition unit complex that has selective binding affinity for a WW domain, with many polypeptides and identifying those with selective affinity for the complex. Proteins containing WW domains are used for targeted drug afmain.
                                    New hexapeptide derivs. having antiarrhythmic activity - useful preventing ischaemia- or age-related rhythm disorders without significant pro-arrhythmic activity

The valency of the recognition unit is important in determining specificity of interaction with WW domains. In multivalent form specificity is relaxed, but not lost, so proteins containing WW domains similar, but not identical, to the sequence of the peptides' target WW can be detected, including new polypeptides.

                    The present sequence represents the new cyclic peptides cyclo(CF3C(OH)-Gly-Ala-Gly-4-Hyp-Pro-Tyr-CONH) and cyclo(CO-Gly-Ala-Gly-4-Hyp-Pro-Tyr-CONH), which are useful as antiarrhythmic agents. They have better stability in solution than the known corresponding linear antiarrhythmic peptide AAP10, i.e. NH2-Gly-Ala-Gly-4-Hyp-Pro-Tyr-CONH2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The patent discloses new hexapeptide compounds having antiarrhythmic activity which are useful for preventing ischaemia- or age-related rhythm discorders without significant pro-arrhythmic activity. They suppress local differences in the duration of action potential and irregularities in the spread of the exciting stimulus. The peptides have the generic formula H2N-X-Ala-Gly-Hyp-Y-Z-NH2 (see Y07540) in which X is Ala Arg, Gly or Val, Y is Pro or His, and Z is Tyr or Phe which is optionally ring-substituted by I, F, Cl or Br. The present sequence represents a preferred example of the new peptides.
                                                                                                                   Claims 1,
                                                                                                                                           New cyclic peptides used as antiarrhythmic agents -
than linear antiarrhythmic peptides
                                                                                                                                                                                   WPI; 1998-468293/41

                                                                                                                                                                                                R95511-R95520 are antigen binding peptides ("abtides"), which bind to a human prostate carcinoma cell antigen. The abtides are identified from random peptide libraries using specific ligand binding. Abtides mimic the binding specificity of large molecules such as antibodies and receptors but have a much smaller size allowing their production at a lower cost and reducing the extent of their immunogenicity aiding in vivo delivery. The abtides are useful for the diagnosis, detection, imaging and treatment of disease, e.g. tumours, prostate cancer.
                                                                                                                                                                                                                                                                                                                        New isolated peptide(s) with specific binding activities - screening random peptide libraries, for use in diagnostic therapeutic compsns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Abtide; prostate specific mucin antigen; human prostate cancer; LNCaP; diagnostic; detection; imaging; tumour; phage; peptide library;

                                                                                                                                                                                                                                                                                                                                                                                                            PAK4, a novel serine/threonine kinase or its mutant homolog. PAK4 is an ceifector for the GTPases Rac and Cdc42Hs which are involved in intracellular signal cascades, morphogenesis and mitogenesis, and activate the JNK and p38 MAP kinase pathways. Inhibiting interaction of PAK4 with these enzymes will thus result in inhibition of actin polymerization and formation of filopodia. The PAK4 nucleic acid used for recombinant production of the protein, and as a source of probes for inhibiting homologous sequences and of (anti)sense oligonucleotides for inhibiting pAK4 expression. The protein, or its fragments, are used to raise specific antibodies and these are useful as ligands for therapeutic inhibition of interaction between PAK4 and its native binding partners. Inhibition of PAK4 activity or expression is used for treatment of cancer and arthritis. The present sequence represents a conserved kinase domain fragment of human PAK65 and yeast STE20. This is used to design

Of all these peptides, only w30829-38 were able to stimulate cytokine release. Other antigenic peptides have also been identified from TRP-1. The nucleic acids encoding the cancer peptides or TRP-2 can be used to detect a cancer or pre-cancer in a mammal, especially by detecting the presence of the alterative ORF 3 of the TRP-1 gene or the sequence encoding the novel tumour antigen TRP-2. Vectors and recombinant viruses containing antigen peptide encoding nucleic acids, antibodies raised against the peptides, or the peptides themselves can be used to prevent or treat a cancer in a mammal,

Rabphilin-3A (Rab3A) is distributed specifically in brain tissue and participates in the release of nerve transmitter substance and is useful in the study
        Example 5;
                         Identifying ligands which mediate biological activity of a protein by identifying target-binding ligands and screening a library for ligands which inhibit target-binding ligand mediated activity
                                                                    WPI; 1998-272389/24.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC A method has been developed for identifying a ligand which mediates the CC biological activity of a target protein (T) by inhibiting the binding CC of (T) to a binding partner. The method comprises: (a) screening a first CC combinatorial library comprising first member ligands for binding to the CC target-binding ligands (TBLs), to identifying one or more TBLs; (b) CC screening a second library comprising second member ligands for the CC ability to inhibit the binding of one or more of the TBLs to the target CC determining which of the inhibitory ligands can mediate a biological activity of the target protein. The present sequence represents a CC potential binding peptide for Haemophilus influenzae tyrosine tRNA CC synthetase from an example of the present invention. The method can be CC used for identifying drugs which can mediate the biological activity of a target protein whose biological function is not known and perhaps CC cannot be determined directly. The method can also be used to identify the biological activity of cannot be determined directly. The method can also be used to identify the biological activity of components of the present sequence represents a component by the distinct arget protein whose biological function is not known and perhaps CC cannot be determined directly. The method can also be used to identify the biological scivily of the present activity of the present activi
